

DOCUMENT TITLE: Stakeholder Requirements & Interview Notes

PROJECT: CarbonTrack: SOAST Students Carbon Footprint Monitoring System

DATE CONDUCTED: May 10, 2026

INTERVIEWERS:

Athea Glaise Tarnate
Prince Wesley Dela Pasion
Brix Charles Caparon
Eucel Penarubia
Christian Camano
Quelly De Los Santos

INTERVIEWEE/STAKEHOLDERS: Representative SOAST Students & Program Head

I. BACKGROUND OF THE INTERVIEW

The purpose of this requirements gathering session is to identify the current pain points in monitoring the carbon emissions of the School of Advanced Studies and Technology (SOAST) students at the National Teachers College (NTC), and to define the necessary features for the proposed CarbonTrack web system.

II. Q&A TRANSCRIPT (SUMMARY)

Question 1: Paano niyo po kasalukuyang namo-monitor ang carbon footprint ng mga estudyante sa departamento? Stakeholder Answer: Sa ngayon, wala kaming standard o centralized na system para diyan. Kung may data man, manual itong kinukuha o via printed forms na napakahirap i-compile. Hindi namin alam kung gaano kalaki ang emissions ng department pagdating sa travel, electricity, at waste.

Question 2: Ano po ang pinakamalaking challenge sa manual process na ito? Stakeholder Answer: Dalawa ang main problem. Una, ang validation. Mahirap kumpirmahin kung tama ba ang inilalagay na data ng mga estudyante. Pangalawa, kapag hinihingi na ng School Management ang sustainability report, inaabot kami ng ilang araw para lang mag-tally at gumawa ng graphs.

Question 3: Kung magkakaroon ng system, anong mga features ang pinaka-kailangan ninyo? Stakeholder Answer: Kailangan namin ng system na may "Separation of Roles" (3-Tier Model).

1. Gusto namin ng portal kung saan madaling makapag-input ng numbers ang mga estudyante para makwenta ang score nila.
2. Kailangan may Dashboard ang mga Program Head para ma-review at ma-Approve/Reject yung inputs ng mga estudyante bago pumasok sa official record.

3. Para sa Management, kailangan ng automatic na Report Generator para isang click lang, lalabas na ang Total Logs at Bar Charts ng buong SOAST program.

III. KEY TAKEAWAYS & SYSTEM ALIGNMENT

Based on the interview, the team concluded that a Strict 3-Tier Architecture with a 3NF Relational Database is required. The UI must be decoupled per user role (Student, Head, Management). The system will automate the calculation engine and provide real-time dashboard updates using strict database feedback loops (Approve/Reject state controllers) to ensure data integrity.
